#### Test Environment/Conditions 2.6

20 ... 25 °C Normal Temperature (NT): Relative Humidity: 30 ... 75 %

980 ... 1020 hPa Air Pressure:

Test frequency: GSM 850MHz /PCS1900MHz;

WCDMA 850MHz/1900MHz;

802.11b(2.4GHz);

Operation mode: Call established

Power Level: GSM 850 MHz Maximum output power(level 5)

PCS1900 MHz Maximum output power(level 0)

WCDMA 850MHz/1900MHz Maximum output power(All up bits)

802.11b Maximum output power(2.4GHz)

During SAR test, EUT is in Traffic Mode (Channel Allocated) at Normal Voltage Condition. A communication link is set up with a System Simulator (SS) by air link, and a call is established.

The Absolute Radio Frequency Channel Number (ARFCN) is allocated to 128, 190 and 251 respectively in the case of GSM 850 MHz, or to 512, 661 and 810 respectively in the case of PCS 1900 MHz, or to 4132, 4182 and 4233 respectively in the case of WCDMA 850MHz, or to 9262, 9400 and 9538 respectively in the case of WCDMA 1900MHz, or to 1, 6, 11 respectively in the case of 802.11b (2.4GHz). The EUT is commanded to operate at maximum transmitting power.

The EUT shall use its internal transmitter. The antenna(s), battery and accessories shall be those specified by the manufacturer. The EUT battery must be fully charged and checked periodically during the test to ascertain uniform power output. If a wireless link is used, the antenna connected to the output of the base station simulator shall be placed at least 50 cm away from the handset.

The signal transmitted by the simulator to the antenna feeding point shall be Middle than the output power level of the handset by at least 35 dB.

# 3. SPECIFIC ABSORPTION RATE (SAR)

#### 3.1 Introduction

SAR is related to the rate at which energy is absorbed per unit mass in an object exposed to a radio field. The SAR distribution in a biological body is complicated and is usually carried out by experimental techniques or numerical modeling. The standard recommends limits for two tiers of groups, occupational/controlled and general population/uncontrolled, based on a person's awareness and ability to exercise control over his or her exposure. In general, occupational/controlled exposure limits are Middle than the limits for general population/uncontrolled.

### 3.2 SAR Definition

The SAR definition is the time derivative (rate) of the incremental energy (dW) absorbed by (dissipated in) an incremental mass (dm) contained in a volume element (dv) of a given density. ( $\rho$ ). The equation description is as below:

$$SAR = \frac{d}{dt} \left( \frac{dW}{dm} \right) = \frac{d}{dt} \left( \frac{dW}{\rho dv} \right)$$

SAR is expressed in units of Watts per kilogram (W/kg)

SAR measurement can be either related to the temperature elevation in tissue by,

$$SAR = C\left(\frac{\delta T}{\delta t}\right)$$

Where C is the specific head capacity,  $\delta T$  is the temperature rise and  $\delta t$  the exposure duration, or related to the electrical field in the tissue by

$$SAR = \frac{\sigma |E|^2}{\rho}$$

Where  $\sigma$  is the conductivity of the tissue,  $\rho$  is the mass density of the tissue and |E| is the rms electrical field strength.

However for evaluating SAR of low power transmitter, electrical field measurement is typically applied.

### 4. SAR MEASUREMENT SETUP

## 4.1 The Measurement System

Comosar is a system that is able to determine the SAR distribution inside a phantom of human being according to different standards. The Comosar system consists of the Following items:

- Main computer to control all the system
- 6 axis robot
- Data acquisition system
- Miniature E-field probe
- Phone holder
- Head simulating tissue

The Following figure shows the system.

The EUT under test operating at the maximum power level is placed in the phone holder, under the phantom, which is filled with head simulating liquid. The E-Field probe measures the electric field inside the phantom. The OpenSAR software computes the results to give a SAR value in a 1g or 10g mass.

### 4.2 Probe

For the measurements the Specific Dosimetric E-Field Probe SN 37/08 EP80 with Following specifications is used

- Dynamic range: 0.01-100 W/kg

- Tip Diameter: 6.5 mm

- Distance between probe tip and sensor center: 2.5mm

Shenzhen Morlab Communications Technology Co., Ltd

Phone: +86 (0) 755 36698555

Web site: <a href="http://www.morlab.cn/">http://www.morlab.cn/</a>

Fax: +86 (0) 755 36698525

Email: info sz@morlab.cn Page 9 of 67

- Distance between sensor center and the inner phantom surface: 4 mm (repeatability better than +/- 1mm)

- Probe linearity: <0.25 dB</li>- Axial Isotropy: <0.25 dB</li>

- Spherical Isotropy: <0.25 dB

- Calibration range: 835 to 2500MHz for head & body simulating liquid.

Angle between probe axis (evaluation axis) and surface normal line: less than 30°

Probe calibration is realized, in compliance with CENELEC EN 62209 and IEEE 1528 std, with CALISAR, Antennessa proprietary calibration system. The calibration is performed with the EN 622091 annex technique using reference guide at the five frequencies.

 $SAR = \frac{4\left(P_{fw} - P_{bw}\right)}{ab\delta} \cos^2\left(\pi \frac{y}{a}\right) e^{-(2z/\delta)}$ 

Where:

Pfw = Forward Power Pbw = Backward Power

a and b = Waveguide dimensions

ı = Skin depth

Page 10 of 67

Keithley configuration:

Rate = Medium; Filter =ON; RDGS=10; FILTER TYPE =MOVING AVERAGE; RANGE AUTO After each calibration, a SAR measurement is performed on a validation dipole and compared with a NPL calibrated probe, to verify it.

Report No.: SZ13120150S01

Phone: +86 (0) 755 36698555

The calibration factors, CF(N), for the 3 sensors corresponding to dipole 1, dipole 2 and dipole 3 are:

CF(N)=SAR(N)/VIin(N) (N=1,2,3)

The linearised output voltage Vlin(N) is obtained from the displayed output voltage V(N) using

 $Vlin(N)=V(N)^*(1+V(N)/DCP(N)) \qquad (N=1,2,3)$ 

Where DCP is the diode compression point in mV.

#### 4.3 Probe Calibration Process

#### 4.3.1 Dosimetric Assessment Procedure

Each E-Probe/Probe Amplifier combination has unique calibration parameters. SATIMO Probe calibration procedure is conducted to determine the proper amplifier settings to enter in the probe parameters. The amplifier settings are determined for a given frequency by subjecting the probe to a known E-field density (1 mW/cm²) using an with CALISAR, Antenna proprietary calibration system.

### 4.3.2 Free Space Assessment Procedure

The free space E-field from amplified probe outputs is determined in a test chamber. This calibration can be performed in a TEM cell if the frequency is below 1 GHz and in a waveguide or other methodologies above 1 GHz for free space. For the free space calibration, the probe is placed in the volumetric center of the cavity and at the proper orientation with the field. The probe is rotated 360 degrees until the three channels show the maximum reading. The power density readings equates to 1 mW/cm².

### 4.3.3 Temperature Assessment Procedure

E-field temperature correlation calibration is performed in a flat phantom filled with the appropriate simulating head tissue. The E-field in the medium correlates with the temperature rise in the dielectric medium. For temperature correlation calibration a RF transparent thermistor-based temperature probe is used in conjunction with the E-field probe.

Where:

Shenzhen Morlab Communications Technology Co., Ltd

Web site: <a href="http://www.morlab.cn/">http://www.morlab.cn/</a>
Fax: +86 (0) 755 36698525
Email: <a href="mailto:info-sz@morlab.cn">info-sz@morlab.cn</a>
Page 11 of 67

 $\delta t = \text{exposure time (30 seconds)},$ 

$$SAR = C\left(\frac{\delta T}{\delta t}\right) \hspace{1cm} C \text{ = heat capacity of tissue (brain or muscle),}$$

 $\delta T$  = temperature increase due to RF exposure.

SAR is proportional to  $\Delta T/\Delta t$ , the initial rate of tissue heating, before thermal diffusion takes place. The electric field in the simulated tissue can be used to estimate SAR by equating the thermally derived SAR to that with the E- field component.

Where:

$$SAR = \frac{\sigma |E|^2}{\rho}$$
 \sigma = simulated tissue conductivity,   
 \rho = Tissue density (1.25 g/cm³ for brain tissue)

#### 4.4 Phantom

For the measurements the Specific Anthropomorphic Mannequin (SAM) defined by the IEEE SCC-34/SC2 group is used. The phantom is a polyurethane shell integrated in a wooden table. The thickness of the phantom amounts to 2mm +/- 0.2mm. It enables the dosimetric evaluation of left and right phone usage and includes an additional flat phantom part for the simplified performance check. The phantom set-up includes a cover, which prevents the evaporation of the liquid.

### 4.5 Device Holder

The positioning system allows obtaining cheek and tilting position with a very good accuracy. In compliance with CENELEC, the tilt angle uncertainty is Middle than 1°.

Device holder

System Material	Permittivity	Loss Tangent

Page 12 of 67

### 5. TISSUE SIMULATING LIQUIDS

For SAR measurement of the field distribution inside the phantom, the phantom must be filled with homogeneous tissue simulating liquid to a depth of at least 15 cm. For head SAR testing, the liquid height from the ear reference point (ERP) of the phantom to the liquid top surface is larger than 15 cm. For body SAR testing, the liquid height from the center of the flat phantom to the liquid top surface is larger than 15 cm. The nominal dielectric values of the tissue simulating liquids in the phantom and the tolerance of 5% are listed in below table.

The following table gives the recipes for tissue simulating liquids

Frequency Band (MHz)	835.00	1900.00	2450.00
Tissue Type	Body	Body	Body
Ingredients (% by weight )			
Deionised Water	50.20	40.40	73.20
Salt(NaCl)	0.90	0.50	0.10
Sugar	48.50	58.00	0.00
Tween 20	0.00	0.00	0.00
HEC	0.20	1.00	0.00
Bactericide	0.20	0.10	0.00
Triton X-100	0.00	0.00	0.00
DGBE	0.00	0.00	26.70
Diethylenglycol monohexylether	0.00	0.00	0.00
Measured dielectric parameters			
Dielectric Constant	56.10	53.30	52.70
Conductivity (S/m)	0.95	1.52	1.95

The dielectric properties of the tissue simulating liquids were verified prior to the SAR evaluation using an Agilent 85033E Dielectric Probe Kit and an Agilent Network Analyzer.

#### 7. SAR MEASUREMENT EVALUATION

### 7.1 System Setup

In the simplified setup for system evaluation, the DUT is replaced by a calibrated dipole and the power source is replaced by a continuous wave which comes from a signal generator. The calibrated dipole must be placed beneath the flat phantom section of the SAM twin phantom with the correct distance holder. The distance holder should touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The system check verifies that the system operates within its specifications. It is performed daily or before every SAR measurement. The system check uses normal SAR measurements in the flat section of the phantom with a matched dipole at a specified distance. The system verification setup is shown as below.

The validation dipole is placed beneath the flat phantom with the specific spacer in place. The distance spacer is touch the phantom surface with a light pressure at the reference marking and be oriented parallel to the long side of the phantom. The power meter PM1 measures the forward power at the location of the system check dipole connector. The signal generator is adjusted for the desired forward power (250 mW is used for 700 MHz to 3 GHz,100 mW is used for 3.5 GHz to 6 GHz) at the dipole connector and the power meter PM2 is read at that level. After connecting the cable to the dipole, the signal generator is readjusted for the same reading at power meter PM2.

### 7.2 Validation Results

After system check testing, the SAR result will be normalized to 1W forward input power and compared with the reference SAR value derived from validation dipole certificate report. The deviation of system check should be within 10 %.

### 8. OPERATIONAL CONDITIONS DURING TEST

### 8.1 Body-worn Configurations

The body-worn configurations shall be tested with the supplied accessories (belt-clips, holsters, etc.) attached to the device in normal use configuration.

For body-worn and other configurations a flat phantom shall be used which is comprised of material with electrical properties similar to the corresponding tissues.

**Illustration for Body Worn Position** 

## 8.2 Measurement procedure

The Following steps are used for each test position

- 1. Establish a call with the maximum output power with a base station simulator. The connection between the mobile and the base station simulator is established via air interface.
- 2. Measurement of the local E-field value at a fixed location. This value serves as a reference value for calculating a possible power drift.
- 3. Measurement of the SAR distribution with a grid of 8 to 16mm \* 8 to 16 mm and a constant distance to the inner surface of the phantom. Since the sensors can not directly measure at the inner phantom surface, the values between the sensors and the inner phantom surface are extrapolated. With these values the area of the maximum SAR is calculated by an interpolation scheme.
- 4. Around this point, a cube of 30 \* 30 \* 30 mm or 32 \* 32 \* 32 mm is assessed by measuring 5 or 8 \* 5 or 8\*4 or 5 mm. With these data, the peak spatial-average SAR value can be calculated.

# 8.3 Description of interpolation/extrapolation scheme

The local SAR inside the phantom is measured using small dipole sensing elements inside a probe body. The probe tip must not be in contact with the phantom surface in order to minimize measurements errors,

Page 20 of 67

Phone: +86 (0) 755 36698555

but the highest local SAR will occur at the surface of the phantom.

An extrapolation is using to determinate this highest local SAR values. The extrapolation is based on a fourth-order least-square polynomial fit of measured data. The local SAR value is then extrapolated from the liquid surface with a 1mm step.

The measurements have to be performed over a limited time (due to the duration of the battery) so the step of measurement is high. It could vary between 5 and 8 mm. To obtain an accurate assessment of the maximum SAR averaged over 10 grams and 1 gram requires a very fine resolution in the three dimensional scanned data array.

#### Note:

- When the 1-g SAR for the mid-band channel or the channel with the Highest output power satisfy the following conditions, testing of the other channels in the band is not required. (Per KDB 447498 D01 General RF Exposure Guidance v05r01)
  - ≤ 0.8 W/kg and transmission band ≤ 100 MHz
  - ≤ 0.6 W/kg and, 100 MHz < transmission bandwidth ≤ 200 MHz
  - ≤ 0.4 W/kg and transmission band > 200 MHz
- 2. SAR evaluation of the DUT on the Front Surface with separation distance of 0 mm to the flat phantom is NOT performed because there is no use case for this configuration.

Shenzhen Morlab Communications Technology Co., Ltd Phone: +86 (0) 755 36698555

 Page 26 of 67

- 3. The WCDMA mode is test with 12.2kbps RMC and TPC set to all "1", if maximum SAR for 12.2kbps RMC is ≤ 75% of the SAR limit (i.e. 1.2W/Kg 1g) and maximum average output of each RF channel with HSDPA/HSUPA active is less than 1/4 dB Middle than that measured without HSDPA/HSUPA using 12.2kbps RMC, according to KDB 941225D01v02, SAR is not required for this handset with HSPA capabilities.
- 4. BT&wifi SAR test is conducted according to section 12 stand-alone SAR evaluation of this report.
- 5. During 802.11b(2.4GHz) testing, engineering testing software installed on the EUT can provide continuous transmitting RF signal. The RF signal utilized in SAR measurement has almost 100% duty cycle, and its crest factor is 1.

#### 6. Scaling Factor calculation

Band	Tune-up power tolerance	SAR test channel	Scaling
Band	(dBm)	Power (dBm)	Factor
GSM 850	PCL = 5, PWR = 31.5+-0.5	31.60	1.096
GPRS 850	PCL = 5, PWR =27.5+-0.5(4 slots)	27.66	1.081

### 11. HOTSPOT MODE EVALUATION PROCEDURE

The SAR evaluation procedures for Portable Devices with Wireless Router function is according to KDB 941225 D06 Hot Spot SAR v01r01.

SAR must be measured for all sides (edges) and surfaces with a transmitting antenna located at  $\leq$  25 mm from that surface or edge, for the data modes, wireless technologies and frequency bands supporting hotspot mode.

Edge configurations:

**Assessment Hotspot side for SAR** Test distance: 0mm **Antennas Back** Edge A Edge B Edge C Edge D WCDMA/GSM Yes Yes No No No **WLAN&BT** Yes No No No Yes

Shenzhen Morlab Communications Technology Co., Ltd Phone: +86 (0) 755 36698555

Page 28 of 67

### 12. MULTIPLE TRANSMITTERS EVALUATION

The are three transmitters build in EUT, as following:

Edge A

Stand-alone SAR

Test distance: 0mm						
Band	SAR Test Exclusion Threshold(mW) Per KDB 447498 D01v05r02	Highest power(mW)				
WIFI(2.4G)	10	28.184				
ВТ	10	1.122				

According to the chart above, WIFI2.4G is required for Stand-alone SAR test, and BT body SAR is not required.

The SAR test for 802.11b(2.4GHz) is required, 802.11g/HT20 is not required, for the maximum average output power is less than 1/4 dB Higher than measured on the corresponding 802.11b channels. As per KDB 248227

The SAR test for BT is not required for highest power is not exceed the power threshold for 2450MHz at the test distance of 5mm.

The BT stand-alone body SAR is not required, the standalone SAR must be estimated according to following to determine simultaneous transmission SAR test exclusion:

(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance,mm)]·[√f(GHz)/x]

Shenzhen Morlab Communications Technology Co., Ltd

Email: info sz@morlab.cn

Web site: <a href="http://www.morlab.cn/">http://www.morlab.cn/</a>
Fax: +86 (0) 755 36698525

Page 29 of 67

Phone: +86 (0) 755 36698555

W/kg for test separation distances ≤ 50 mm;

where x = 7.5 for 1-g SAR, and x = 18.75 for 10-g SAR.

(Max power= 1.122 mW; min. test separation distance= 5 mm for body; f=2.4GHz)

BT estimated Body SAR = 0.046W/Kg (1g)

#### Simultaneous SAR

	Description of Simultaneous Transmit Capabilities						
No.	Transmitter Combinations	Scenario Supported ?	Supported for Mobile Hotspot ?	Explanation			
1	GSM(Voice)+GSM(Data)	No	No				
2	WCDMA(Voice)+WCDMA(Data)	Yes	Yes				
3	GSM(Voice)+WCDMA(Data)	No	No	Note 4			
4	WCDMA(Voice)+GSM(Data)	No	No	Note 1			
5	GSM(Data)+WCDMA(Voice)	No	No				
6	GSM(Voice)+WCDMA(Voice)	No	No				
7	GSM(Voice)+WiFi (/ BT)	Yes	No	Note 2			
8	WCDMA(Voice)+WiFi (/BT)	Yes	No	Note 2			
9	WCDMA(Voice)+WCDMA(Data)+WiFi	Yes	Yes				
10	GSM(Data)+WiFi	Yes	Yes	Note 3			
11	WCDMA(Data)+WiFi	Yes	Yes				

Not applicable	Applicable	Body-worn	Hotspot
1,3,4,5,6	2,7,8,9,10,11	2,7,8,9	2,9,10,11

#### Note:

- 1. EUT system architecture does not support simultaneous voice and data (except on WCDMA), multiple voice channels, or multiple data channels during a single session on the cellular net work.
- 2. Supported for voice plus background data, we do not test head SAR since the EUT has not receiver and voice function is only limited to loudspeaker and earphone..
- 3. Support for mobile hotspot operation.
- 4. When the user enables the personal wireless router functions for the handset, actual operations include simultaneous transmission of both the WiFi transmitter and another licensed transmitter. Both transmitter often do not transmit at the same transmitting frequency and thus cannot be evaluated for SAR under actual use conditions. The "Portable Hotspot" feature on the handset was NOT activated, to ensure the SAR measurements were evaluated for a single transmission frequency RF signal.
- 5. The hotspot SAR result may overlap with the body-worn accessory SAR requirements, per KDB 941225 D06, the more conservative configurations can be considered, thus excluding some unnecessary body-worn accessory SAR tests.

Shenzhen Morlab Communications Technology Co., Ltd Phone: +86 (0) 755 36698555

Web site: <a href="http://www.morlab.cn/">http://www.morlab.cn/</a>
Fax: +86 (0) 755 36698525

Page 30 of 67

Email: info sz@morlab.cn

Phone: +86 (0) 755 36698555

- 6. GSM supports voice and data transmission, though not simultaneously. WCDMA supports voice and data transmission simultaneously.
- 7. Simultaneous Transmission SAR evaluation is not required for BT and WiFi, because the software mechanism have been incorporated to guarantee that the WLAN and Bluetooth transmitters would not simultaneously operate.
- 8. For Scenario **No.2**,**8**,**9**,**11**, WCDMA and WiFi is tested separately, the WCDMA mode is test with 12.2kbps RMC and TPC set to all "1", if maximum SAR for 12.2kbps RMC is ≤ 75% of the SAR limit (i.e. 1.2W/Kg 1g) and maximum average output of each RF channel with HSDPA/HSUPA active is less than 1/4 dB Middle than that measured without HSDPA/HSUPA using 12.2kbps RMC, according to KDB 941225D01v02, SAR is not required for this handset with HSPA capabilities.
- 9. For Scenario **No.7**,**10**, GSM and WiFi is tested separately, the GSM mode do not supports voice and data transmission simultaneously, voice (GSM) and data (GPRS/EDGE) is tested separately.
- 10. The NFC function operates at 13.56MHz, the power threshold of SAR evaluation is 474mW(Per KDB 447498 D01v05r02 Appendix C), the NFC operates at relatively much lower power; The NFC function is not active when carrying on the body. So SAR evaluation is not need for NFC function.

#### 1. Applicable Multiple Scenario Evaluation

Test	WCDMA&GSM	Bluetooth		∑1-g SARMax(W/Kg)	
Position	SARMax (W/Kg)	SAR(W/Kg)	SARMax(W/Kg)	BT&Main Ant	WiFi&Main Ant
Body SAR	0.495	0.046	0.122	0.541	0.617

Simultaneous Transmission SAR evaluation is not required for Wifi and WCDMA&GSM, because the sum of 1g SARMax is **0.617**W/Kg < 1.6W/Kg for Wifi and WCDMA&GSM.

Simultaneous Transmission SAR evaluation is not required for BT and WCDMA&GSM, because the sum of 1g SARMax is **0.541**W/Kg < 1.6W/Kg for BT and WCDMA&GSM.

(According to KDB 447498D01v05, the sum of the Highest <u>reported</u> SAR of each antenna does not exceed the limit, simultaneous transmission SAR evaluation is not required.)
